NTP (Network Time Protocol) and PTP (Precision Time Protocol) are two different protocols used for synchronizing clocks on computer networks. NTP is one of the oldest and most widely used protocols for time synchronization. It works based on a hierarchical architecture of time servers, where higher-level servers synchronize with reference time sources like atomic clocks or GPS receivers and provide time to lower-level servers, which in turn provide time to their clients. PTP, on the other hand, is a more advanced protocol commonly used in industrial control systems or applications that require highly accurate time synchronization. PTP is capable of achieving sub-microsecond synchronization accuracy, which makes it suitable for applications such as high-frequency trading, telecommunication networks, or power grid systems. While NTP is a widely used protocol for general time synchronization requirements, PTP is designed for applications that demand highly accurate and precise time synchronization. Time servers play a crucial role in both protocols by providing reliable time signals to network devices and endpoints.

The global NTP and PTP Servers market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
