The Nuclear Control Rod Drive System is a crucial component in nuclear reactors responsible for regulating and controlling the fission reaction. It typically consists of control rods made of neutron-absorbing materials, such as boron or cadmium, which are inserted or withdrawn into the reactor core to manage the rate of nuclear reactions and maintain reactor stability. The drive system involves mechanisms, such as motors or hydraulic systems, to control the precise positioning of these control rods. By adjusting the position of the control rods, the system can regulate the neutron flux, enabling operators to achieve and maintain the desired level of reactor power and control the reactor's overall behavior during operation, shutdown, and emergencies. The Nuclear Control Rod Drive System is fundamental for ensuring the safe and controlled

operation of nuclear power plants.

The industry is witnessing increased interest in nuclear power as a clean energy source, driven by the global push for decarbonization and the need for reliable, low-emission electricity.
