The global Nuclear Grade Condensate Polishing Resin market size is predicted to grow from US\$ 123 million in 2025 to US\$ 162 million in 2032; it is expected to grow at a CAGR of 4.1% from 2026 to 2032.

Nuclear grade condensate polishing resins are high-purity ion-exchange resins utilized in the condensate polishing systems of nuclear power plants. Their primary function is to remove sodium, chloride, silica, sulfate, iron, copper, corrosion products, and trace radioactive impurities from the condensate before it returns to the steam generators or reactor feedwater systems, thereby mitigating the risks of corrosion and deposition within the water-steam cycle.

The upstream sector primarily involves raw materials such as styrene, divinylbenzene, acrylic monomers, initiators, porogens, sulfuric acid, chloromethyl methyl ether (or alternative chloromethylation reagents), and similar substances. The midstream sector encompasses the production of nuclear-grade cationic resins, anionic resins, mixed-bed resins, and powdered resins. The downstream sector primarily serves applications within nuclear power plants, specifically in condensate polishing systems, reactor water purification systems, makeup water demineralization systems, and startup flushing systems.

In 2025, global sales volume is projected to reach approximately 19,000 m³, with a global average price of approximately US\$6,600 per cubic meter; the gross profit margins for major industry manufacturers are estimated to range between 38% and 55%.
