## Abstracts

The global Nuclear Land Inspection Robot market size is predicted to grow from US\$ 117 million in 2025 to US\$ 204 million in 2032; it is expected to grow at a CAGR of 8.3% from 2026 to 2032.

Nuclear land inspection robot is an intelligent mobile device specifically designed for high-radiation environments such as nuclear power plants. Their core function is to replace manual labor, performing tasks such as autonomous patrols, environmental monitoring (e.g., radiation dose rate), equipment status checks, and video image transmission in routine or emergency situations. They address the pain point of extremely high radiation exposure risks faced by manual inspections in nuclear environments. The upstream supply chain mainly includes suppliers of core components and raw materials, such as radiation-resistant alloy materials, radiation-resistant chips and sensors (e.g., radiation detectors, radiation-resistant cameras), servo motors, and precision reducers. The downstream primarily targets end-users in the nuclear power sector, including nuclear power plant operators (such as CGN and CNNC), nuclear facility maintenance service providers, and nuclear decommissioning and waste disposal units. Application scenarios cover in-service inspections, emergency response, and routine maintenance. In 2025, the production volume of nuclear land inspection robots is estimated at approximately 1,500 units, with an average price of approximately US\$80,000 per unit, a gross profit margin of approximately 40%, and a single-line production capacity of 50 units per year.

United States market for Nuclear Land Inspection Robot is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
