The global Nuclear Medicine Diagnostic Equipment market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Nuclear medicine diagnosis mainly refers to nuclide imaging diagnosis, which can be divided into single photon emission computed tomography (SPECT) and positron emission computed tomography (PET) according to the different ways and types of radioactive elements used to emit gamma photons. Its principle is to inject single-photon/positron radioactive drugs into the human body, and then use SPECT or PET equipment to image the distribution of radionuclides, so as to analyze the function or metabolism of various organs to diagnose diseases. .

In terms of the popularity and advancement of the product, SPECT was used clinically before PET, and the penetration rate is higher than that of PET, but the imaging effect of PET is clearer, the radiation damage to the human body is less, and it is more advanced than SPECT. In recent years, the development of PET The market is also growing faster. PET equipment is usually fused with CT and MRI to form PET/CT and PET/MR, and SPECT equipment is usually fused with CT to form SPECT/CT. Separate PET and SPECT equipment have gradually withdrawn from the market.

Currently commonly used medical imaging methods include X-ray imaging, ultrasound imaging, CT, nuclear magnetic resonance MRI, SPECT/CT, PET/CT and PET/MR.
