A nuclear medicine radioactivity meter is an instrument used for medical purposes to detect and record the type, quantity, energy, time variation and spatial distribution of radiation emitted by radionuclides. This instrument plays a vital role in nuclear medicine. It provides important information for the diagnosis, treatment and research of diseases through the measurement of radioactive isotopes. The working principle of nuclear medicine radioactivity meter is mainly based on the interaction between radiation and matter. When the radiation emitted by radioactive isotopes interacts with matter, effects such as ionization and excitation will occur. These effects can be captured by the detector and converted into electrical signals for processing and recording. By analyzing and processing these signals, we can obtain information such as the type, quantity, energy, time variation and spatial distribution of radioactive isotopes.

The global Nuclear Medicine Radioactivity Meter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
