The global Nuclear Receptor Screening Services market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Nuclear receptors (NRs) are ligand-activated transcription factors that regulate gene expression and play a key role in endocrine signaling. They bind to ligands (usually small lipophilic molecules such as steroids, vitamins, and fatty acid derivatives) and activate transcription of the genome, play different roles in cell differentiation, development, proliferation, and metabolism, and are associated with a variety of diseases, such as cancer, cardiovascular disease, inflammation, and reproductive abnormalities. This makes it one of the most important targets for therapeutic drug development.

Nuclear receptor screening services involve testing and analyzing compounds to determine their interaction with nuclear receptors. Nuclear receptors are a class of proteins found within cells that are responsible for sensing steroid and thyroid hormones, as well as certain other molecules. They play a critical role in regulating gene expression and maintaining physiological processes.
