Nucleic acid transfection reagents are used to transfect exogenous nucleic acids (such as DNA, RNA, etc.) into target cells in vitro cell culture experiments. Nucleic acid transfection reagents can be used for experiments such as gene overexpression or gene silencing, helping researchers study the function and regulatory mechanisms of target genes. By transfecting exogenous DNA or RNA, gene expression or inhibition can be achieved, thereby studying its role in cell biology, biochemistry, and pathophysiology. In the process of drug development, nucleic acid transfection reagents can be used to evaluate the impact of drugs on specific genes or signaling pathways, thereby screening candidate drugs with potential therapeutic effects. In addition, it can also be used for targeted therapy research, such as gene therapy and RNA interference (RNAi) therapy.

The global Nucleic Acid Transfection Reagents market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
