## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Nucleic acid diagnosis is a method of diagnosis of human body state and disease by using the theory and technology of molecular biology to directly investigate the existence state or defect of nucleic acid, analyze the function of nucleic acid from the nucleic acid structure, replication, transcription or translation level. Its target molecule is DNA or RNA, which reflects the structure and function of nucleic acids. The genes tested are endogenous (that is, the body's own genes) and exogenous (such as viruses, bacteria, etc.), the former is used to diagnose whether the gene has disease, the latter is used to diagnose whether there is pathogen infection.
