The global Nutrient Recovery Systems market size is predicted to grow from US$ 717 million in 2025 to US$ 1296 million in 2031; it is expected to grow at a CAGR of 10.4% from 2025 to 2031.

Nutrient recovery refers to the manure treatment technologies and methods that allow farmers to reduce the farm's nutrient surplus.

Nutrient recovery, defined as the proportion of nutrients supplied that is taken up by the crop in above-ground parts, varies strongly from field to field. The general mechanisms are known, yet poorly understood in quantitative terms. Fertilizer recommendations, e.g. using QUEFTS, are based on simple rules of thumb for expected recovery fractions. These are typically derived from experiments that may not reflect on-farm field conditions very well. As such, fertilizer recommendations and expectations of crop yields are on average pretty good, yet come with large errors at farm level. Farmers may be more realistically informed about expected yield responses when fertilizer recovery is better understood, especially under poor soil fertility conditions with low yields.
