Nylon casting refers to the production of nylon through a casting method. The casting method involves the reaction of monomers, the raw materials, within a mold to create the material. As the resin cools, internal strain can develop within the material, potentially leading to deformation and, in some cases, breakage. Compared to other molding methods, less strain is generated during the casting process, resulting in superior dimensional stability. Additionally, reduced deformation due to strain results in a material that is stronger than standard nylon.

The global Nylon Casting market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
