Abstracts

The global α -Ga α O α Single Crystal market size is predicted to grow from US\$ 427 million in 2025 to US\$ 1172 million in 2032; it is expected to grow at a CAGR of 15.8% from 2026 to 2032.

α -Ga α O α single crystal is an ultra-wide-bandgap (UWBG) semiconductor material with a bandgap of $\sim$ 4.8 eV, offering extremely high breakdown fields and enabling next-generation power electronics such as high-voltage switches, Schottky diodes, and RF power components. In 2024, the global average price of α -Ga α O α wafers is approximately US\$2,050 per 2" equivalent wafer, with annual production reaching around 185,000 wafers. Gross margins typically range from 38%–55%, driven by crystal growth difficulty, melt control, material purity, dislocation minimization and low-defect polishing. The supply chain includes upstream high-purity Ga α O α materials, precision crystal growth furnaces, iridium crucibles, slicing and CMP consumables; midstream companies perform CZ/EFG crystal growth, wafering and epi-layer deposition; downstream clients include power semiconductor manufacturers, research labs, high-voltage converter makers and new-energy power electronics developers.

α -Ga α O α is emerging as a strategic material for high-voltage and high-efficiency power electronics, offering performance beyond Si, GaN and even 4H-SiC in certain voltage domains. While device commercialization is still early, investments from power IC makers and national labs are accelerating wafer-level scaling from 2" to 4" and pilot 6". The primary growth momentum through 2031 will come from high-voltage power switches, fast chargers, renewable-energy converters and defense RF applications.
