The oblique mapping camera is a photogrammetric device that collects images from five different angles: vertical, front, rear, left, and right. Its core function is to obtain high-resolution image data from multiple angles of ground objects, and combine it with the IMU/DGPS system to obtain high-precision attitude and position information, and finally generate a realistic three-dimensional model. Oblique mapping cameras are widely used in surveying and mapping, ancient building protection, real estate registration, urban planning and other fields. 3D oblique mapping cameras are suitable for high-precision 3D city mapping and 3D corridor mapping applications.
