Observation Space Representation (OSR) correction service is an important service type in GNSS (Global Navigation Satellite System) high-precision positioning technology. OSR correction service mainly receives GNSS satellite signals in real time through a reference station network (such as GNSS base station) and calculates the expected observation error of the user's location. These errors include errors caused by various factors such as satellite orbit error, satellite clock error, ionospheric delay, tropospheric delay, etc. Then, the correction service provider transmits these expected observation error information to the user wirelessly, and the user uses this error information to perform positioning calculations to improve positioning accuracy. OSR correction service is widely used in fields that require high-precision positioning, such as surveying, engineering, agriculture, drones, autonomous driving, etc. In these fields, high-precision positioning is crucial to ensure the quality of operations, improve production efficiency and ensure safety. For example, in the agricultural field, OSR correction service can help farmers achieve precise planting, fertilization and irrigation operations; in the field of autonomous driving, OSR correction service can provide accurate location information for autonomous driving vehicles to ensure safe and stable driving of vehicles on the road.

The global Observation Domain (OSR) Correction Service market size is projected to grow from US\$ 417 million in 2024 to US\$ 628 million in 2030; it is expected to grow at a CAGR of 7.1% from 2024 to 2030.

With the increasing demand for high-precision positioning, observation domain (OSR) correction services have been widely used in many fields, such as agriculture, construction, GIS and surveying, ocean, etc. The requirements for positioning accuracy in these fields are constantly increasing, which has promoted the growth of the OSR correction service market. OSR correction service technology continues to advance, improving positioning accuracy and stability. Traditional OSR correction services rely on differential systems, local enhancement systems, etc., and eliminate errors through differential technology to achieve high-precision positioning. In addition, with the development of technology, OSR correction services are gradually developing in a more efficient and intelligent direction, such as introducing machine learning, artificial intelligence and other technical optimization algorithms to improve data processing speed and accuracy. The application areas of OSR correction services are constantly expanding. In addition to traditional fields such as agriculture, construction, GIS and surveying, they are gradually penetrating into emerging fields such as autonomous driving and smart cities. These emerging fields have a strong demand for high-precision

positioning, providing new growth points for the OSR correction service market. In summary, the observation domain (OSR) correction service market is in a rapid development stage. In the future, the OSR correction service market is expected to usher in a broader development prospect.
