Obstetric ultrasonic transducer is a specialized medical device used in obstetrics and gynecology to visualize and monitor the development and well-being of the fetus. It employs ultrasound technology to generate and receive sound waves to create real-time images of the fetus and the surrounding structures within the mother's womb.

The transducer, also known as a probe, emits high-frequency sound waves into the body, which then bounce back as echoes when they encounter different tissues or structures. These echoes are collected by the transducer and converted into visual images on a screen or monitor. Obstetric ultrasonic transducers are designed to be

safely used on the mother's abdomen.
