The global Ocrelizumab market size is predicted to grow from US\$ 965 million in 2025 to US\$ 3378 million in 2032; it is expected to grow at a CAGR of 15.6% from 2026 to 2032.

In 2025, global production of Obinutuzumab reached approximately 8.6 million units. Ocrelizumab is a humanized monoclonal antibody primarily used for the treatment of Multiple Sclerosis (MS), including Relapsing Remitting Multiple Sclerosis (RRMS) and Primary Progressive Multiple Sclerosis (PPMS). It works by targeting and inhibiting the activity of B cells, reducing the immune system's attack on the central nervous system, thereby slowing disease progression and reducing relapses. Ocrelizumab is administered via intravenous injection, typically once every six months. The drug has been approved for clinical use in multiple countries and regions, particularly for MS patients who have not responded well to other treatment options.?

Ocrelizumab is a first-line biologic pharmaceutical drug for the treatment of Multiple Sclerosis (MS), and holds an important position in the global market. With the increasing early diagnosis rates of MS, the demand for effective treatments is steadily rising, leading to growing market demand for Ocrelizumab. Particularly in the treatment of Relapsing Remitting Multiple Sclerosis (RRMS) and Primary Progressive Multiple Sclerosis (PPMS), Ocrelizumab has gradually become a key treatment choice due to its significant efficacy and relatively low side effects. The market prospects for Ocrelizumab are very promising, especially in developed countries and regions, where its excellent efficacy and dosing schedule of once every 6 months greatly improve patient compliance, making it highly favored by both patients and doctors. However, despite its significant therapeutic advantages, the high price of the drug may limit its accessibility in some countries or regions with lower economic conditions.
