OCS All-Optical Switching (Optical Circuit Switching) is a technology used in optical networks to route data using light signals instead of converting them to electrical signals. This method involves the direct switching of optical signals from one optical fiber to another without the need for optical-to-electrical and electrical-to-optical conversions. By leveraging optical switches, OCS can achieve high-speed data transfer, reduced latency, and increased bandwidth efficiency compared to traditional electronic switching methods. This technology is crucial for high-capacity and high-speed communication networks, such as those used in telecommunications and data centers, enabling more efficient and scalable network management.

The global OCS All-Optical Switching market size is projected to grow from US$ million in 2024 to US$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
