The global Odor Control Scrubber market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Odor control scrubber is a device specially designed to treat odors in exhaust gas. It usually includes multiple washing areas, such as primary, secondary and tertiary washing areas, each area has its specific functions and design. In the first-level washing area, it is usually equipped with a fully automatic backwash filter, which can filter the water in the water tank and recycle it. At the same time, the pH value in the washing tank is detected through an online pH meter, and water supply and drainage are automatically performed according to changes in pH value to maintain the liquid. quality and save water. In the secondary and tertiary washing areas, there are special fillers. When the gas passes through the fillers, some odor molecules are absorbed into the water tank to achieve the purpose of removing odors and dust. At the same time, these washing areas are also equipped with online detection instruments to ensure the quality of water and liquid.

As technology advances, odor control scrubbers may pay more attention to efficiency and intelligent design. For example, by optimizing the design of the washing area, the waste gas treatment efficiency is improved; at the same time, with the help of advanced sensors and control systems, the automated and intelligent operation of the equipment is realized, reducing manual intervention and improving operating efficiency.
