OEM Electrostatic Chucks (ESCs) are specialized components used in semiconductor manufacturing processes, particularly in the fabrication of integrated circuits (ICs).

An electrostatic chuck is a device used to hold silicon wafers or substrates securely in place during various processes such as etching, deposition, and lithography. It utilizes electrostatic forces to clamp the wafer onto its surface without the need for physical clamps or vacuum suction. This clamping mechanism is crucial in maintaining stability and precision during semiconductor manufacturing.

OEM (Original Equipment Manufacturer) Electrostatic Chucks refer to these chucks that are designed and manufactured by original equipment manufacturers, as opposed to third-party vendors or aftermarket suppliers. OEM ESCs are often tailored to specific semiconductor equipment, ensuring compatibility and optimal performance within the semiconductor fabrication process. They are typically integrated into semiconductor manufacturing equipment such as etchers, deposition systems, or lithography tools provided by OEMs.

The global OEM Electrostatic Chucks market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
