A off-road vehicle high intensity arc lamp is an arc lamp, so there is no heated precision filament. Instead, light is generated by an electric arc between two tungsten electrodes housed inside the arc tube. The translucent tube is filled with gas and metal salt. The gas assists in the initial ignition of the arc. Once the arc starts, it heats and vaporizes the metal salts that form the plasma, which greatly increases the intensity of light produced by the arc. HID lamps cannot operate directly on low voltage DC current. They need an igniter and ballast to boost the voltage. Most modern high intensity arc lamps have the igniter and ballast built into the housing, but some off-road HID lights have an externally mounted igniter and ballast, which complicates installation.

The global market for Off-Road Vehicle High Intensity Arc Lamps is estimated to increase from US\$ million in 2021 to reach US\$ million by 2028, exhibiting a CAGR of % during 2022-2028. Keeping in mind the uncertainties of COVID-19 and Russia-Ukraine War, we are continuously tracking and evaluating the direct as well as the indirect influence of the pandemic on different end use sectors. These insights are included in the report as a major market contributor.
