Offset UV dryer is a printing device that uses ultraviolet (UV) radiation to dry ink. In the offset printing process, after the ink is transferred to the substrate, the solvent in the ink needs to be quickly evaporated through the drying equipment to solidify the ink on the surface of the substrate. The offset UV dryer uses ultraviolet rays to irradiate the surface of the ink, triggering a chemical reaction in the photosensitizer in the ink, thereby achieving rapid drying of the ink. Offset UV dryer usually consists of UV light source, reflector, heat dissipation system, control system and other parts. The UV light source is the core component for generating ultraviolet rays, and usually uses a high-power UV lamp or LED light source. The reflector is used to evenly irradiate ultraviolet rays to the surface of the ink to improve the drying efficiency. The heat dissipation system is used to ensure that the UV light source maintains an appropriate temperature during operation to prevent overheating damage. The control system is responsible for monitoring and adjusting the operating status of the dryer to ensure the best drying effect.

United States market for Offset UV Dryer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
