The global Offshore Carbon Sequestration market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Offshore Carbon Sequestration is the process of capturing carbon dioxide (CO₂) emissions from industrial sources or power plants and storing it in geological formations beneath the seabed. This technology aims to reduce the amount of CO₂ released into the atmosphere, thereby helping to mitigate climate change. The key steps involved in offshore carbon sequestration include capturing CO₂, transporting it to an offshore site, and injecting it into suitable geological formations for long-term storage.
