A Offshore Turbine Pile Foundation is a widely used offshore wind turbine support structure consisting of a single large-diameter steel pipe pile driven vertically into the seabed. It serves as the primary foundation type for wind turbines installed in shallow to moderate water depths (typically up to 30-40 meters). The monopile is directly connected to the transition piece and turbine tower, providing a simple, cost-effective, and structurally robust solution. Wind monopile foundation upstream mainly involves heavy steel plates, flanges, welding and corrosion-protection materials, while downstream is driven by offshore wind farm developers, EPC contractors, and marine installation companies for turbine foundation construction.
