Offshore Wind Floating Foundations are support structures used to anchor wind turbines in deep water where traditional fixed-bottom foundations are impractical. These floating platforms, which can be tethered to the seabed with mooring lines and anchors, allow turbines to be installed in waters deeper than 60 meters, expanding the potential for wind energy generation in offshore locations. They are designed to remain stable in harsh marine conditions and are essential for tapping into stronger and more consistent wind resources found far from shore, thereby enhancing the viability and efficiency of offshore wind farms.

The global Offshore Wind Floating Foundations market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
