The global Offshore Wind Turbine Blade market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Offshore Wind Turbine Blade is the core component of offshore wind turbine tower. Offshore wind power is one of the development trends of the wind power industry in the future, and will also become one of the major increases in the market demand of the midstream wind turbine blade industry. Compared with onshore wind power, offshore wind power has the characteristics of high stability, high wind speed and easy consumption. Offshore wind speeds are typically 20% higher than onshore, and there are fewer quiet periods of wind, allowing for longer power generation. Therefore, offshore wind power has the prospect of large-scale development in the future, which will drive the new demand for wind turbine blades.

According to the Global Wind Report 2023 released by the Global Wind Energy Council, by 2024, the newly installed capacity of global onshore wind power will exceed 100GW for the first time; by 2025, the newly installed capacity of global offshore wind power will also reach 25GW. In the next five years, the newly added grid-connected capacity of wind power will reach 680GW. The report also shows that the United States and Europe may experience a supply bottleneck of wind turbines and components in 2025. It recommends that national policymakers take immediate action to increase investment in supply chains to meet their rapid growth in demand and avoid supply chain bottlenecks hindering the development of wind power. In addition, according to Wood Mackenzie statistics, China is the largest and fastest-growing market for wind power generation in the world, accounting for more than half of the market share. Data from the National Energy Administration of China also shows that China's installed wind power capacity

ranks first in the world, with a capacity of nearly 400 million kilowatts.
