The global Oil Anti Emulsification Testers market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Oil anti-emulsification testers are devices used to evaluate the ability of oils, particularly lubricants and hydraulic fluids, to resist the formation of emulsions when mixed with water. Emulsions can negatively impact the performance of oils by reducing their lubricating properties, leading to increased wear and corrosion. These testers typically involve adding a specific volume of water to a known volume of oil and then subjecting the mixture to controlled conditions, such as heat or agitation. The results indicate how well the oil can separate from the water, with better-performing oils showing less emulsion formation. The test results can help manufacturers and users select oils with suitable properties for their applications, ensuring optimal performance and longevity of equipment.
