## Abstracts

The global Oil Filter Media market size is predicted to grow from US\$ 13450 million in 2025 to US\$ 18227 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

Oil filter media are engineered porous materials used in automotive, industrial, and heavy-duty oil filters to remove contaminants such as metal particles, carbon residues, soot, and oxidation by-products from lubricating oil, ensuring engine protection, fluid cleanliness, and extended service life. The supply chain begins upstream with raw materials including cellulose pulp (wood-based fibers), synthetic fibers (polyester, polypropylene), glass microfibers, and resin binders, followed by midstream processes such as fiber blending, wet-laid or melt-blown media forming, resin impregnation, calendaring, and surface treatments to achieve specific filtration efficiency, dirt-holding capacity, and temperature resistance; downstream, the finished filter media are pleated, cut, and integrated by oil filter manufacturers into spin-on filters, cartridge filters, and hydraulic filter elements, which are then supplied to OEMs and aftermarket channels serving passenger vehicles, commercial trucks, industrial machinery, construction equipment, and power generation systems. In 2025, the global oil filter media market records an annual production volume of approximately 10.8 billion square meters against a global production capacity of about 14 billion square meters per year, with average media-basis unit prices ranging from USD 1.1 to 2.3 per square meter, while the industry maintains an average gross margin of around 32%.
