The global Oil Immersed Hermetically Sealed Transformer market size is predicted to grow from US\$ 7030 million in 2025 to US\$ 9378 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

An Oil Immersed Hermetically Sealed Transformer is a power transformer in which the wire windings and core are sealed in a hermetically sealed metal case by insulating oil. It can provide power conversion from high voltage to low voltage or low voltage to high voltage, and can also play the role of isolation, voltage stabilization, and voltage reduction in power systems.

Oil Immersed Hermetically Sealed Transformers are normally manufactured with a sealed tank equipped with fins that allow for the expansion at the said temperature variations. The tightness of the tank is up to 0.5 Bar. This type of transformer is the most widely used globally. In the hermetically sealed transformer, the oil does not come into contact with air and its electrical properties are therefore not compromised, ensuring a long life span of the transformer. For power ratings exceeding 3150kVA, or in case of a transformer with radiators, the transformer can still be hermetically sealed by means of a nitrogen cushion. These type of distribution transformers can be designed and manufactured bespoke with top or side connections.
