The global Oil Immersed Transformer Radiators market size is predicted to grow from US\$ 1066 million in 2025 to US\$ 1634 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

In 2025, global Oil Immersed Transformer Radiator output reached about 605,000 units, supported by an installed production capacity of about 785,000 units per year, with average unit price USD 1,800, and an average gross margin of around 29%. Oil immersed transformer radiators are external heat-dissipation assemblies attached to oil-filled power and distribution transformers, designed to remove heat generated in the windings and magnetic core by circulating hot insulating oil from the main tank through finned panels, tubular banks, or detachable cooling sections, where heat is transferred to ambient air via natural convection (ONAN) or forced air/oil systems (ONAF/OFAF). In the supply chain, upstream inputs include low-carbon steel plates or tubes (often with corrosion-resistant coatings), welding consumables, transformer-grade gaskets, valves, flanges, and surface treatment chemicals (shot blasting, phosphating, powder coating or epoxy paint), along with fabrication equipment such as roll-forming lines and automated seam welders; midstream manufacturing involves panel forming, robotic welding, leak testing, pressure testing, oil-flow channel integration, surface coating, and quality certification (e.g., ISO, utility standards), typically by specialized radiator manufacturers or vertically integrated transformer OEMs; downstream, radiators are supplied either directly to transformer OEMs (e.g., large power transformer manufacturers) for new-build units or to utilities and EPC contractors for retrofits and replacements, ultimately serving end users such as transmission and distribution utilities, renewable energy plants, industrial facilities, rail electrification systems, and data centers where thermal management is critical for transformer reliability and lifecycle performance.
