An oil-injected helical-lobe compressor is a type of positive-displacement compressor that uses intermeshing helical (screw-shaped) rotors to compress gases, with oil injected into the compression chamber to lubricate, cool, and seal the rotors. The helical lobes on the male and female rotors create sealed volumes that decrease as the rotors turn, forcing the gas to compress. The injected oil forms a protective film between the rotors and housing, reducing friction and wear while absorbing heat generated during compression. This design allows for high-efficiency compression of gases (such as air, natural gas, or industrial gases) with minimal pulsation and noise. Commonly used in industrial applications like air supply systems, petrochemical processing, and refrigeration, these compressors are valued for their reliability, long service life, and ability to handle varying loads efficiently.
