The global Oil Level Controller market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The oil level controller is a device used to control and adjust the oil level in the compressor tank, which can be divided into electronic and mechanical types. The mechanical oil controller is a device having inside a float suitable to maintain a constant oil level in the compressor. The electronic oil level controllers work by measuring the oil level through optical sensors. The principle of optical detection of the oil level is based on the fact that a light signal emitted on to a glass returns a different refraction depending on whether the glass is immersed in vapour rather than in a liquid. The electronic oil level regulators work by measuring the oil level through optical sensors. The principle of optical detection of the oil level is based on the fact that a light signal emitted on to a glass returns a different refraction depending on whether the glass is immersed in vapour rather than in a liquid.
