An oil-lubricated piston air compressor is a type of air compressor that uses oil as a lubricant for its moving parts, specifically the pistons. This type of compressor typically consists of a cylinder, piston, crankshaft, connecting rod, and a lubrication system. The oil serves multiple purposes in an oil-lubricated piston air compressor. Firstly, it acts as a lubricant for the piston and other moving components, reducing friction and minimizing wear and tear. This helps to increase the lifespan and efficiency of the compressor. Secondly, the oil also helps to cool down the compressed air, as the air passing through the compressor can become quite hot due to the compression process.

The oil absorbs the from the compressed air, preventing overheating and potential damage to the compressor. Additionally, the oil also helps to seal the gap between the piston and cylinder walls creating an airtight seal. This is crucial for maintaining high compression efficiency and preventing air leakage, which can result in reduced performance.
