An oilless washer is a type of sliding bearing designed to handle thrust loads without the need for lubricating oil. These loads, also known as axial loads, are applied parallel to the shaft's longitudinal direction. Oilless washers facilitate the sliding movement of rotating bodies by providing surface support, crucial in environments where applying grease or lubricating oil is impractical.

By incorporating materials with inherent lubricating properties, oilless washers reduce sliding friction and wear, even in environments devoid of traditional lubrication.

The global Oilless Washer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
