The global OK Lens Materials market size is predicted to grow from US\$ 367 million in 2025 to US\$ 770 million in 2032; it is expected to grow at a CAGR of 11.4% from 2026 to 2032.

OK Lens?Orthokeratology lenses?are special contact lenses that are worn mainly at night to correct vision and control the development of eye diseases by changing the shape of the cornea, especially myopia . Orthokeratology lens material is a highly oxygen-permeable polymer material used to make orthokeratology lenses, which meets the three major characteristics of high oxygen permeability, high biocompatibility, and high fracture strength.

OK lens (Orthokeratology lens) are special contact lenses that are mainly worn at night to correct vision by changing the shape of the cornea. The OK lens material is a highly oxygen-permeable polymeric material used to make orthokeratology lens, which meets the three major characteristics of high oxygen permeability, high biocompatibility, and high fracture strength. The supply of upstream raw materials presents an oligopoly. Currently, there are only four companies with production capacity in the world, namely Menicon from Japan, Bausch & Lomb from the United States, Paragon from the United States, and Contamac from the United Kingdom (acquired by Haohai Biotech). Among them, Menikon can only produce raw materials for daily wear contact lenses (RGP lenses), and the remaining three have the qualifications to produce night-wear orthokeratology lens materials.. OK lens manufacturers in the Chinese market all rely on imported raw materials. Most manufacturers use Bausch and Lomb lens, such as DreamVision China, Lucid Korea, Euclid USA, and Alfa Japan; C&T USA and CRT USA companies use Paragon lenses, and Aibo Nord uses Contamac lenses.
