The global Oleylamine market size is predicted to grow from US\$ 163 million in 2025 to US\$ 224 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

Oleylamine is a long-chain unsaturated fatty primary amine prepared from oleic acid, oil alcohol, or oil-based raw materials through processes such as amination, hydrogenation amination, or nitrile hydrogenation. Its typical structure is eighteen carbon unsaturated fatty amine, with a CAS number of 112-90-3. At room temperature, it is mostly a colorless to light yellow oily liquid with hydrophobic long carbon chains and active amino structures. It has functions such as surface activity, emulsification, dispersion, adsorption, lubrication, corrosion prevention, and complexation. It is mainly used in the fields of surfactant intermediates, mineral flotation collectors, asphalt emulsifiers, lubricant additives, metal corrosion inhibitors, pesticide additives, coating dispersants, nanomaterial synthesis ligands, and fine chemical intermediates. In 2025, global Oleylamine production reached approximately 54.26 K MT, with an average global market price of around US\$ 3,065 per MT.

Oleylamine belongs to the functional fine chemicals in the fatty amine system, and its demand is supported by mining flotation, oilfield chemicals, asphalt modification, agrochemical preparations, metal processing, lubricating materials, and special surfactants. In terms of segmentation, the oleic acid primary amine market presents a characteristic of 'not as large as tertiary amines and quaternary ammonium salts, but with higher functional added value'. Industrial grade products mainly focus on cost, supply stability, and fatty amine purity, while high-purity products enter more into nanomaterials, electronic materials, pharmaceutical research, and high-end dispersion systems. Future opportunities mainly come from upgrading green mining flotation reagents, optimizing low VOC coatings and agrochemical additives formulations, increasing demand for industrial corrosion inhibitors and lubricants, as well as increasing research and development of nanomaterials and high-end fine chemicals;

The main pressure comes from fluctuations in the prices of raw materials such as oleic acid, vegetable oils, and fatty alcohols, as well as increased requirements for odor, color, amine value, iodine value, freezing point, and impurity control, and rising costs of environmental and safety compliance.
