Oligo synthesis, also known as oligonucleotide synthesis, is a laboratory technique used to chemically synthesize short sequences of nucleic acids, typically DNA or RNA oligonucleotides. These oligonucleotides are composed of relatively short chains of nucleotides, usually less than 100 bases in length. Oligos (or oligonucleotides) are commonly used as primers in PCR (polymerase chain reactions) to selectively amplify target DNA sequences. They can be tagged with fluorescent dyes or radioisotopes for detection purposes. Oligos are often used in DNA sequencing, gene synthesis, and genetic testing, and can be modified for gene therapies or gene expression.

The global Oligo Synthesis market size is projected to grow from US\$ 685 million in 2024 to US\$ 1353 million in 2030; it is expected to grow at a CAGR of 12.0% from 2024 to 2030.
