## Abstracts

The global Oligonucleotide market size is predicted to grow from US\$ 1629 million in 2025 to US\$ 2963 million in 2031; it is expected to grow at a CAGR of 10.5% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Oligonucleotides are short nucleic acid polymers used in research, genetic testing and forensics.

Oligonucleotides are usually made up of 13 to 25 nucleotides and are designed to hybridize specifically to DNA or RNA sequences. Solid-phase clinical synthesis is used to manufacture these small bits of nucleic acid for use in polymerase chain reaction (PCR), DNA sequencing, library construction and artificial gene synthesis.

Oligonucleotide drugs have the advantages of high therapeutic efficiency, low drug toxicity, and strong specificity, and have great potential in the treatment of metabolic diseases, genetic diseases, cancer, and prevention of infectious diseases. In recent years, due to the unique advantages of oligonucleotides in regulating gene expression, the research and development, production and commercialization of their drugs have developed rapidly, and the global market has continued to expand.
