DNA Synthesis refers to the process of artificially synthesizing DNA molecules under laboratory conditions. DNA synthesis is usually carried out through chemical synthesis methods, using known nucleotide monomers (A, T, C, G) in a specific order to gradually assemble the target DNA sequence in a test tube. DNA synthesis has a wide range of applications in the field of biotechnology, such as gene cloning, gene editing, synthetic biology and other fields. Scientific researchers and biotechnology companies can use DNA synthesis technology to design and synthesize specific DNA sequences for research on gene function, biomedical research and development, bioinformatics, etc. The development of DNA synthesis technology allows scientists to quickly and accurately synthesize DNA sequences of various lengths and complexities, providing powerful tools and support for life science research and biotechnology applications.
