Olivine is the name of a group of rock-forming minerals that are typically found in mafic and ultramafic igneous rocks such as basalt, gabbro, dunite, diabase, and peridotite. They are usually green in color and have compositions that typically range between Mg_2SiO_4 and Fe_2SiO_4 . Most olivine found at Earth's surface is in dark-colored igneous rocks. It usually crystallizes in the presence of plagioclase and pyroxene to form gabbro or basalt. These types of rocks are most common at divergent plate boundaries and at hot spots within the centers of tectonic plates.

The global Olivine Materials market size is projected to grow from US\$ 143 million in 2024 to US\$ 157 million in 2030; it is expected to grow at a CAGR of 1.6% from 2024 to 2030.
