## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

An Omni wheel is a wheel that can move in any direction. It consists of a main rotating part on the body and a passive rotating part of rollers placed on the outer circle of the body. Usually, a set of three wheels or a set of four wheels is used. Compared to a wheel configuration with tires using a steering wheel, such as in an automobile, the moving mechanism is simpler, making it suitable for smaller sizes and lighter weight.

Omni wheels are mainly used as moving mechanisms for robots and carts. Because they are suitable for moving in confined spaces, they are often used as an unmanned transport robot in factories and warehouses, or as a wheelchair for indoor environments such as hospitals.

Omni wheels as an unmanned transport robot also include a robot with a human tracking function equipped with sensors. Since the Omni wheels can move with work equipment on them, they can be used as both a dolly and a work platform.

The global Omni Wheel market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
