Omnirange Radio Beacon (OR) is a type of radio navigation system used in aviation. It is also known as VHF omnidirectional range (VOR).

OR/VOR is a ground-based radio navigation system that provides pilots with accurate and reliable information about their position and heading. It works by transmitting radio signals in all directions from a ground station. The signals are received by an aircraft's onboard navigation equipment, which allows the pilot to determine their radial distance and bearing from the station.

The system uses a network of ground stations that are typically spaced 100 to 200 miles apart. Each station transmits a unique radio frequency, and the pilot can tune into the desired frequency to receive navigation information. The pilot can then use this information to navigate along specific airways or to fly directly to a particular station.

OR/VOR is widely used in aviation due to its accuracy and reliability. It provides continuous navigation information, allowing pilots to track their position and make course corrections as needed. It is especially useful during instrument flight, where pilots rely on instruments rather than visual references.

In recent years, newer navigation systems such as GPS (Global Positioning System)

have become more prevalent in aviation. However, OR/VOR still remains an important backup and supplementary navigation tool, especially in areas where GPS signals may be unreliable or unavailable.
