The on-board central computing unit is one of the core components of intelligent connected cars. Its main task is to provide sufficient computing power to support business logic related to intelligent driving and intelligent cockpits. It integrates high-performance, high-computing power automotive hardware SOC (System on Chip, system-on-chip), integrating multiple microprocessors, analog IP cores, digital IP cores and memory components on a single chip, such as CPU , GPU, DSP, ISP, Codec, NPU, Modem and other modules.

As the highest decision-making layer, the central computing unit exchanges data with various sensors, actuators and traditional ECU (electronic control unit) nodes through high-bandwidth and low-latency communication capabilities to realize the vehicle's networking function and connect to the vehicle terminal. and the cloud. Based on the Zone architecture of the central computing unit, the software is built using SOA (service-oriented architecture) to support software iteration and ecological expansion on the software platform.

In addition, the central computing unit also has powerful computing power and mature visual processing chip solutions, which can effectively ensure the control and response of the vehicle-machine system and meet the computing power and communication needs of future vehicle-machine system functional integration.

Generally speaking, the on-board central computing unit is the brain of an intelligent connected car, responsible for processing various data of the vehicle and executing complex algorithms and control logic to achieve intelligent driving, intelligent cockpit and

other functions.

The global On-board Central Computing Unit market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
