The global One-button Image Measuring Instrument market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

One-button Image Measuring Instrument, also known as image measuring ruler and flash image size measuring instrument, is the representative of a new image measuring technology. The core hardware of the one-button image measuring instrument is composed of upper and lower light sources, a high-pixel CCD camera, a telecentric lens with a wide viewing angle and a large field of view, and a fixed stage.

One-button image measuring instrument is a new type of image measurement technology. It is different from the traditional two-dimensional image measuring instrument in that it no longer needs a grating scale displacement sensor as an accuracy mark, nor does it use a large focal length lens to magnify the product image to ensure measurement accuracy. The one-button image measuring instrument uses a telecentric lens with a large viewing angle and a large depth of field to reduce the product contour image by several times or dozens of times, and then transmits it to a high-resolution CCD camera with millions of pixels for digital processing. The background drawing measurement software with powerful computing power then quickly captures the product contour map according to pre-programmed instructions, and finally calculates the product size after comparing it with the ruler formed by the tiny pixels of the high-pixel camera, and completes the evaluation of the dimensional tolerance at the same time. The one-button image measuring instrument has a simple body structure and does not require a displacement sensor grating scale. It only needs a telecentric magnification reduction lens with a large viewing angle and a large depth of field, a high-pixel CCD camera, and a background software with powerful computing

power.
