Rail sleepers are essential components of track structures, typically laid horizontally on the roadbed beneath the rails. Depending on the material used, they are classified as wooden, concrete, or steel. One-piece synthetic sleepers are advanced composite railway sleepers made of materials such as continuous fiberglass-reinforced polyurethane foam (FFU) and molded into a single piece. Unlike traditional multi-section sleepers, these sleepers utilize novel materials. Compared to traditional wood and concrete sleepers, these sleepers offer advantages such as high strength, light weight, excellent corrosion and fatigue resistance, long service life, excellent insulation, and reduced noise and vibration. They are widely used in urban and mainline rail transit, particularly in Japan and China, to improve safety, reliability, and cost-effectiveness.
