A One-shot Cephalostat is a specialized device used in radiographic imaging, particularly in orthodontics and craniofacial studies, to capture precise and standardized lateral or frontal X-ray images of the skull, known as cephalograms. The "one-shot" refers to the ability of the device to take the required image in a single exposure, ensuring that the patient's head is positioned consistently and accurately. The cephalostat typically includes adjustable ear rods and a forehead support to stabilize the patient's head, minimizing movement during the imaging process. This ensures reproducibility and accuracy in measurements, which are essential for diagnostic and treatment planning purposes in dentistry, orthodontics, and maxillofacial surgery.
