The global One-Step Reverse Transcription PCR Reagents market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

One-Step Reverse Transcription PCR Reagents are laboratory reagents designed for a combined reverse transcription and polymerase chain reaction (PCR) process in a single reaction tube. These reagents streamline the workflow by allowing the conversion of RNA into complementary DNA (cDNA) and subsequent PCR amplification in one step. Typically, these reagents include reverse transcriptase enzyme, DNA polymerase, and other necessary components for both reactions.

This one-step approach is advantageous for its simplicity and time efficiency, making it suitable for gene expression analysis, RNA quantification, and other applications where a quick and simplified process is desired. Researchers can save time and reduce the risk of contamination by performing reverse transcription and PCR in a single reaction vessel.
