The global One-Stop Cloud Supercomputing Platform market size is predicted to grow from US$ 1919 million in 2025 to US$ 5551 million in 2032; it is expected to grow at a CAGR of 16.7% from 2026 to 2032.

A one-stop cloud supercomputing platform refers to a centralized, elastically scalable computing service platform based on cloud computing and high-performance computing (HPC) technologies. It integrates computing resources, storage resources, network resources, and software services, providing services to users in various fields such as scientific research, industrial design, artificial intelligence, and big data analysis. These platforms typically feature integrated functions including on-demand resource allocation, job management, computing power scheduling, data security, visualization analysis, and application development environments. This allows users to complete complex computing tasks and large-scale data processing without building their own local supercomputing centers, thereby reducing costs, improving efficiency, and accelerating scientific research and engineering innovation.

The downstream users of one-stop cloud supercomputing platforms are primarily research institutes, universities, enterprise R&D departments, artificial intelligence training teams, financial quantitative analysis, energy exploration, life sciences, and meteorological simulation industries, providing them with high-performance computing, data processing, model training, and simulation services. These users rely on the platform to obtain computing power and storage resources on demand, enabling rapid iteration and cost optimization of computing tasks. The platform's profit model mainly includes charging based on computing power duration, subscription services, professional customized solutions, and value-added technical services. Overall, these types of platforms typically have high gross profit margins, generally around 58%.
