The global Online Condition Monitoring Systems market size is predicted to grow from US\$ 3485 million in 2025 to US\$ 5678 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

An online condition monitoring system is a technical system that uses sensors, data acquisition units, communication networks, and analysis software to continuously, in real time, and automatically collect and analyze key physical parameters (such as vibration, temperature, pressure, current, and speed) of industrial equipment during operation.

The development of online condition monitoring systems is mainly driven by the increasing complexity and operational continuity requirements of industrial equipment, the urgent need of enterprises to reduce unplanned downtime losses and maintenance costs, the in-depth promotion of predictive maintenance concepts in smart manufacturing, the decline in the cost and performance improvement of sensor and IoT technologies, and the maturity of artificial intelligence and big data analysis capabilities. At the same time, stricter safety production regulations, the popularization of critical asset reliability management standards, and the emphasis on energy efficiency optimization and digital transformation in the energy and process industries have further accelerated the large-scale deployment and intelligent upgrading of this system in high-value equipment scenarios such as power, petrochemical, rail transportation, and wind power.
