The permanganate index method is used to monitor water quality, which is defined as the amount of oxygen consumed by potassium permanganate when treating water samples with potassium permanganate solution for 10 minutes in an acidic environment at a temperature of 100 °C, expressed in mg/L. Mix the sample with dilute sulfuric acid, then heat it to about 100 °C, and add KMnO_4 for the first time. Depending on the measurement range, other substances can be added after the first addition. Online analysis refers to the analytical technique of using an automatic sampling system to automatically input samples into analytical instruments for continuous or intermittent continuous analysis. Compared with classical chemical analysis or laboratory instrument analysis, online analysis has the characteristics of fast analysis speed, high efficiency (can analyze dozens or even hundreds of samples per hour), simple operation, high degree of automation, saving manpower and reagent usage. It can achieve continuous monitoring and computerized data processing, eliminating human error.
