Abstracts

The global Online PGNAA/PFTNA Multi-Element Ore Analyzer market size is predicted to grow from US\$ 57.23 million in 2025 to US\$ 95.05 million in 2032; it is expected to grow at a CAGR of 7.6% from 2026 to 2032.

An Online PGNAA/PFTNA Multi-Element Ore Analyzer is an industrial process analyzer installed on conveyor belts, chutes, slurry pipelines or process bypasses to continuously measure the elemental composition of ores, concentrates, tailings, sinter feed, potash, phosphate and other mineral streams. The system uses prompt gamma neutron activation analysis, pulsed fast and thermal neutron activation, or related neutron activation methods to irradiate the full material stream and detect characteristic gamma-ray spectra generated by the interaction between neutrons and the material. A typical system integrates a neutron source or electronic neutron generator, gamma-ray detectors, radiation shielding, safety interlocks, spectral analysis software, calibration models, a control cabinet and digital interfaces to plant control systems. It provides real-time measurements of elements or oxide-equivalent variables such as Fe, Cu, Ni, S, Si, Al, Ca, Mg, K and Cl, enabling ore sorting, blending, stockpile control, mill feed optimization, flotation control, sinter basicity management and reconciliation across mining and mineral processing operations.

Based on our research, the Online PGNAA/PFTNA Multi-Element Ore Analyzer market should be treated as a narrow, high-specialization segment within mining process instrumentation rather than a broad online ore sensor market. The defining feature of this product category is the use of neutron activation technology to measure the elemental composition of the full material stream on a belt, in a chute or in a slurry pipeline. Its value proposition is strongest where delayed laboratory assays are insufficient for blending, routing, mill feed stabilization, flotation control or sinter quality

management. Compared with XRF, LIBS, XRT or optical sensing, neutron activation systems offer stronger full-stream representativeness and penetration, but they also involve higher capital cost, radiation shielding, licensing, source management or neutron generator maintenance, and more complex calibration requirements. For this reason, the addressable market remains relatively small but strategically important for high-throughput mining and mineral processing operations.

Demand growth is expected to be steady rather than explosive. The strongest drivers are ore grade variability, critical mineral development, the need to improve feed consistency, digital mine programs, and the economics of reducing laboratory delay in high-throughput operations. Iron ore, copper, nickel, gold, phosphate, potash and sinter feed are among the most credible application areas. Future competition will depend less on hardware alone and more on application-specific calibration, process-control integration, neutron source strategy, service responsiveness and the ability to demonstrate measurable value in ore sorting, blending and recovery improvement. The main substitution risk comes from XRF, LIBS, XRT, online XRD and hyperspectral systems, but these technologies do not fully replicate the same full-stream neutron activation measurement characteristics.
